(54) Title: TABLET FORMULATION WITH INTERNAL DESICCANT

(57) Abstract

A tablet formulation comprising a pesticide and a delivery system, the delivery system comprising a range of acid/base combinations, a dispersant, a wetting agent, polyvinylpolypyrrolidone, and a characterizing internal desiccant to ensure tablet stability, the tablet being selected to complement the particular class of base selected for the formulation.

TITLE

## TABLET FORMULATION WITH INTERNAL DESICCANT

An effervescent tablet produces gas bubbles by the reaction between an acid  
5 and a base. Should the water level in the tablet exceed about 0.1%, the tablet will begin to lose its effervescence even though it is stored in its container. Normally, an amount of water exceeding 0.1% is required to formulate a tablet having acceptable integrity and strength.

One way to keep the water employed during formulation from ruining the  
10 tablet during long-term storage is to package the tablet with a desiccant. The water in the tablet diffuses out and is taken up by the desiccant. This water is held by the desiccant and so cannot cause the acid/base reaction to occur. However, the need for an external desiccant complicates design of the tablet package.

15 One such tablet formulation that does not have an internal desiccant is disclosed in WO 90/00007. Two formulations that contain an internal desiccant are disclosed in CA-A-2,013,918 and WO 88/09161. CA-A-2,013,918 discloses a tablet comprising potassium carbonate and/or potassium bicarbonate as bases and a desiccant which physically adsorbs water. WO 88/09161 discloses an  
20 effervescent tablet for cleaning dentures comprising pancreatin, an acid component, a base component, and a drying agent.

SUMMARY OF THE INVENTION

This invention comprises a tablet formulation consisting essentially of by total weight of the formulated composition:

- 25 (i) about 0.1% to 75% of a pesticide;  
(ii) about 25% to 99.9% of a delivery system characterized by a panel of components complementary to the pesticide of (i) having the following components:  
30 (a) about 5% to 75% of a dibasic or tribasic organic carboxylic acid or a mixture thereof;  
(b) about 5% to 75% of an ammonium, lithium, sodium or potassium carbonate or bicarbonate or a mixture thereof;  
(c) about 0.5% to 20% of a dispersant;  
(d) about 0.1% to 5% of water-insoluble cross-linked polyvinyl-  
35 polypyrrolidone;

(e) about 0.1% to 5% of an anionic or nonionic wetting agent; and  
(f) about 1% to 20% of an internal desiccant being selected from the

group:

- 5 (A) one or a mixture of desiccants that chemically bind water, and  
(B) one or a mixture of desiccants that physically adsorb water;  
the desiccant being (A) when (b) is potassium carbonate or potassium  
bicarbonate.

This delivery system is characterized by the inter-relationship of components (a) to (f) in the recited ranges to effect rapid disintegration of finely dispersed pesticide particles (i). Preferred ranges of the composition are 5% to 10% more preferably 10% to 60% of the pesticide; and 30% to 95%, more preferably 40% to 90% of the delivery system.

By "tablet formulation" is meant the tablet made from the composition described herein, as well as the composition formulated in accordance with this disclosure but not in tablet form. The preferred tablet formulation of the present invention is in the form of a tablet.

Contemplated pesticides include those selected from the following classes, including mixtures thereof: herbicides, fungicides, bactericides, insecticides, nematocides, acaricides, and growth regulants.

20 Preferred dibasic and tribasic organic carboxylic acids include citric, fumaric, phthalic, maleic, malic, oxalic, adipic, glutaric, 2-methyl glutaric, succinic, and tartaric, or mixtures of any of them.

The term "dispersants" includes sodium, potassium, ammonium and calcium salts of naphthalene sulfonic acid-formaldehyde condensates; lithium, sodium, 25 potassium, calcium, and ammonium salts of lignosulfonates; sodium; potassium and ammonium salts of polyacrylates and carboxylates; sodium salts of maleic anhydride-isobutylene copolymers; and water soluble nonionic polymers such as polyvinyl-pyrrolidone, polyethylene oxides and cellulose derivatives. Preferred dispersants include the sodium, potassium, ammonium and calcium salts of 30 naphthalene sulfonic acid-formaldehyde condensates, with the ammonium salts more preferred.

Water-insoluble, cross-linked polyvinylpolypyrrolidone disintegrant refers to any of the generic, but is not limited to, crospovidone disintegrating agents.

35 The term "anionic wetting agent" includes, but is not limited to, salts of alkylbenzene sulfonates, alkyl and dialkylnaphthalene sulfonates, alkyl and

alcohol sulfates, sulfoalkylamides, carboxylates, alpha-olefin sulfonates and dialkyl sulfosuccinates. The term "nonionic wetting agent" includes acetylenic diols, ethylene oxide-propylene oxide copolymers, alkylphenol ethoxylates, fatty acid ethoxylates, alcohol ethoxylates, sorbitan fatty acid ester ethoxylates and 5 castor oil ethoxylates. The preferred wetting agents are sodium dialkyl sulfosuccinates of which sodium diisobutyl sulfosuccinate, sodium diamyl sulfosuccinate and sodium dicyclohexyl sulfosuccinate are more preferred.

The internal desiccants that "chemically bind" water are those that actually undergo chemical reactions with water to form a new compound. An example of 10 this type of material is CaO which reacts with water to form Ca(OH)<sub>2</sub>. Other materials representative of those which react in this manner are magnesium oxide and boric anhydride.

The internal desiccants that "physically adsorb" water are those selected from the group consisting of highly-dispersed silicic acids such as silica gel; 15 aluminum oxide; clays such as montmorillonite; and amorphous and crystalline aluminosilicates such as molecular sieves and zeolites. Combinations of these desiccants with those that form hydroxides and hydrates can be used. Kirk-Othmer's Encyclopedia of Chemical Technology (3rd ed., Vol. 8, p 115) describes desiccants suitable for use in the tablet formulation of this invention as Type 1 20 and Type 4 desiccants. Either type can be employed, singly or in combination, as long as the desiccant does not expand when it picks-up water. Such expansion causes the tablet to crack or crumble on long term storage.

Internal desiccants useful in the tablet formulation of this invention also include materials that chemically bind water, not in the sense of a chemical 25 reaction that forms a hydroxide, but in the sense of a chemical reaction that produces a hydrate. Representative of useful desiccants that form hydrates are CaSO<sub>4</sub>, NaOAc, MgSO<sub>4</sub>, Na<sub>2</sub>SO<sub>4</sub>, CaCl<sub>2</sub>, and ZnSO<sub>4</sub>. Representative of the hydrate-forming reaction is that undergone by CaCl<sub>2</sub> to form CaCl<sub>2</sub>·H<sub>2</sub>O. One or 30 more desiccants from each group, the hydroxide-forming and the hydrate-forming, can be employed, alone or in combination, depending on the particular properties sought by the formulator. In any event, the desiccants employed in the tablets of this invention are not those of the water-adsorbing type employed in prior art tablet formulations. Kirk-Othmer's Encyclopedia of Chemical 35 Technology (Third Edition, Vol. 8, page 115) further describes desiccants of the type contemplated for this invention as so-called Type 1 materials.

A preferred tablet formulation is one wherein component (b) is an ammonium, sodium or lithium carbonate or bicarbonate or mixture thereof, and the internal desiccant is selected from (A), (B) and a mixture of (A) and (B).

Also preferred is a tablet formulation wherein (b) is potassium carbonate or bicarbonate or mixture thereof, and the internal desiccant is (A).

Preferred pesticides are those having a melting point of at least about 100°C and solubility in pH 7 water at 20°C of no more than about 5% by weight.

Representatives of such pesticides are herbicides such as: acifluorfen, asulam, atrazine, bensulfuron, bentazon, bromacil, bromoxynil, chloramben, chlorimuron

10 ethyl, chloroxuron, chlorsulfuron, chlortoluron, clomazone, cyanazine, dazomet, desmediphan, dicamba, dichllobenil, dichlorprop, diphenamid, dipropetryn, diuron, thiameturon, 2-[[[N-(4-methoxy-6-methyl-1,3,5-triazine-2-yl)-N-methylamino]carbonyl]amino]sulfonyl]benzoic acid, methyl ester, fenac, fenuron, fluometuron, fluridone, fomesafen, glyphosate, hexazinone, imazamethabenz,

15 imazaquin, imazethapyr, ioxynil, isoproturon, isouron, isoxaben, karbutilate, lenacil, MCPA, MCPB, mefluidide, methabenzthiazuron, methazole, metribuzin, metsulfuron methyl, monuron, naptalam, neburon, nitralin, norflurazon, oryzalin, perfluidone, phenmedipham, picloram, prometryn, pronamide, propazine, pyrazon, siduron, simazine, sulfometuron methyl, tebuthiuron, terbacil,

20 terbutylazine, terbutryn, triclopyr, 2,4-D, 2,4-DB, triasulfuron, primisulfuron, 2-[3-(4,6-bis(difluoromethoxy)pyrimidin-2-yl)ureidosulfonyl]benzoic acid methyl ester, 5-pyrazolesulfonamide, N-[(4-methoxy-6-methyl-pyrimidine-2-yl)-amino-carbonyl]-4-methoxy-carbonyl-1-methyl-, N-[(4,6-dimethoxy-2-pyrimidinyl)-amino]carbonyl]-3-(ethylsulfonyl)-2-pyridinesulfonamide, 2-[[[[(4,6-dimethoxy-

#### DETAILS OF THE INVENTION

- The most common method for applying water insoluble pesticides is as fine aqueous dispersions which are sprayed onto the field or crop using ground or aerial spray rigs. The tablets of this invention combine a high level of physical integrity with rapid break-up in water using minimal or no agitation while providing fine dispersions of active ingredient. Since the spray nozzles are
- 35

typically protected against clogging by 50 mesh screens (U.S. mesh size), the dispersions must be fine enough to pass through this size screen without plugging it. This ability is characteristic of pesticide dispersions delivered by the delivery system of this invention.

5        High physical integrity of the tablets is desirable so that the tablets themselves can withstand the tabletting operation and survive handling, packaging and shipping without breaking. An axial breaking strength of greater than about  $9 \times 10^3$  newtons is generally necessary for a tablet to survive such treatment.

10      Rapid break-up in water is desirable for the convenience of the growers who require quick turnaround times for the preparation of the dispersions. Generally, the tablets of the invention disperse completely in less than 10 minutes, most in less than 5 minutes using even the cold water drawn from wells in the early spring.

15      It is substantially impossible to obtain rapid break-up of a tablet of substantially water-insoluble active ingredient in aqueous media without the use of effervescence. The reaction of the organic acid and carbonate or bicarbonate base affords carbon dioxide gas which aids in this respect.

20      A dispersant is required so that the particles of the active ingredient formed during the disintegration of the tablet remain separated in the cold, hard water.

25      The disintegrant allows the penetration of the water into the interior of the tablet through a wicking or swelling action. Common starch or cellulose-based disintegrants are unsuitable in agricultural applications as they typically form gels on the 50 mesh spray nozzle screens. Hence, a water insoluble cross-linked polyvinylpolypyrrolidone is used.

30      A wetting agent is required to control the size of the carbon dioxide bubbles formed during the reaction of the acid base. The wetting agent reduces the surface tension between the bubbles and the solid tablet resulting in the formation of smaller bubbles which readily detach from the tablet surface. As a consequence, the tablet remains submerged in the water for a longer period of time, thus improving contact of the entire tablet surface with water.

35      If a tablet floats immediately after being dropped in the water its top rapidly dries out and the reaction slows down there. This increases the time required for complete dispersion of active ingredient. When a tablet sinks, water wets the entire exterior of the tablet. Then, when the tablet floats to the surface (as a result of the buoyancy of the attached carbon dioxide bubbles when the tablet has

5 partially dispersed and become lighter) the top remains wet so that effervescent reaction continues. Dispersion times for active ingredients formulated as described herein are very much more rapid than in formulations that produce tablets designed for flotation. To ensure that the tablet will sink initially, inert ingredients are employed that produce a tablet with a density greater than that of water (specific gravity greater than 1.00).

10 Inert ingredients up to 99.9% of the total weight of the composition can be employed. Inert fillers such as sugar or clay can be added as long as they do not affect the chemical stability of the active ingredient(s). Materials such as glidants, anti-adherents, and lubricants can also be employed to facilitate production in the tablet press. The amounts and types of such ingredients will be readily determinable by one skilled in the tabletting art given the disclosure herein.

15 The formulation ingredients are typically ground and mixed in a mill, e.g., an air or hammermill. The ground premix is passed through a 50 or 100 mesh (U.S.A. Standard Sieve Series) screen. The average particle size of the ground premix should be in the range of 5 to 15 microns. If it is much smaller, the tablet will be strong, but will not break up very fast. If the premix is much larger, the dispersion will not be fine enough to pass a wet screen test used to indicate 20 whether the dispersion will clog the spray nozzle and protective screen discussed previously.

25 The tablets can be prepared using conventional tablet-making equipment. Their diameter can vary from about 1 cm or less, to 7.5 cm, depending on the tablet weight desired. Flat-faced, beveled-edge punches, with or without a breakline, produce attractive tablets.

To keep the tablet from sticking to the die or punch faces, a lubricant such as magnesium stearate or boric acid can be used. Such lubricants and anti-adherents can be brushed onto the die surface or incorporated into the formulation.

30 Tablets have been formed in a hydraulic press with a capacity of 18,000 kg of force. Pressures between about  $3.43 \times 10^7$  to  $6.86 \times 10^7$  pascals will produce strong tablets that break up rapidly. Break-up times are determined by dropping a tablet, typically 5 to 15 g into 1000 mL of water. The "end point" of final dispersion is easy to determine because the tablet floats to the surface as it loses 35 weight shortly before it finally disperses.

The resultant dispersion is then poured through a nest of 50/100/200 mesh screens (300 mm, 150 mm, 75 mm holes, respectively). A qualitative judgment is then made about the amount of material that is retained on each screen. A good tablet will leave just a "trace" on the 200 mesh screen, and the larger screens will 5 be free of residue.

The strength of the tablet can be measured by a tester such as the Erweka® Model TBH 28. The tablet is stood on end and the machine tip moves to the tablet along an axial path. The force to break the tablet in two is normally recorded in newtons (N). Good tablets normally have strengths in the range of 10  $8.896 \times 10^3$  to  $4.448 \times 10^4$  N.

#### EXAMPLE 1

The following ingredients were weighed out and milled for 1 min in a Tekmar® A-10 analytical laboratory mill. The premix was passed through a 50 mesh screen and blended well. A 15 g tablet, 4.34 cm in diameter, was made 15 with a hand-operated hydraulic press at a pressure of 525 kg/cm<sup>2</sup>.

	Concentration, Weight %
Ingredient	
Thifensulfuron methyl	55.3
Citric Acid	10.0
Sodium Bicarbonate	25.4
Lomar PWA® (ammonium salt of naphthalene sulfonic acid-formaldehyde condensate)	5.7
Polyplasdone XL-100® (polyvinylpolypyrrolidone)	1.22
Monawet MB-100® (sodium diisobutyl sulfosuccinate)	1.05
Magnesium Oxide	1.33

The fresh tablet took 2 min and 23 sec to dissolve in 25°C water with only a trace of solids on the screens. A second 15 g tablet was allowed to sit at room temperature for 3 days to allow the water in it to diffuse into the internal desiccant 30 (MgO). The tablet was sealed in a tight jar and aged at 45°C for 3 weeks. This accelerated aging simulates about two years of storage at ambient conditions. After aging, the tablet took 3 min and 10 sec to dissolve in 25°C water. The wet screens had only a trace of solids on them.

EXAMPLE 2

The following ingredients were milled and tableted as in Example 1.

	Monawet MB-100® (sodium diisobutyl sulfosuccinate)	1.00
	Molecular Sieves	6.00

The fresh tablet took 2 min and 50 s to break-up in 25°C water. There was  
 15 only a trace of solids on the screens. The second tablet was aged as in Example 1.  
 After aging, the tablet took 2 min and 51 s to break-up. There was only a trace of  
 solids on the wet screens.

EXAMPLES 3 TO 19

In the same manner employed for Example 1, tablets can be prepared using  
 20 the active ingredients in the first column of Table 2 with one or more of the  
 desiccants listed in the second and third columns, except that when the base  
 employed is potassium carbonate or bicarbonate, the desiccant(s) employed  
 therewith are to be selected solely from Column A.

form a five-membered ring containing an oxygen atom together with X or Y).

EXAMPLE 37

The pesticide, described in more detail in U.S. 4,710,221, is a compound of  
5 the formula:

wherein

- 10      R is H or CH<sub>3</sub>;
- R<sub>1</sub> is C<sub>1</sub>-C<sub>3</sub> alkyl, C<sub>3</sub>-C<sub>4</sub> alkoxyalkyl, C<sub>2</sub>-C<sub>4</sub> haloalkyl, C<sub>3</sub>-C<sub>4</sub> alkenyl or C<sub>3</sub>-C<sub>4</sub> alkynyl;
- R<sub>2</sub> is C<sub>2</sub>-C<sub>6</sub> alkoxy, C<sub>3</sub>-C<sub>6</sub> cycloalkoxy, C<sub>4</sub>-C<sub>6</sub> cycloalkylalkoxy, C<sub>1</sub>-C<sub>6</sub> haloalkoxy, C<sub>2</sub>-C<sub>6</sub> alkenyloxy, C<sub>2</sub>-C<sub>6</sub> haloalkenyloxy, C<sub>3</sub>-C<sub>6</sub> alkynyloxy, C<sub>3</sub>-C<sub>6</sub> haloalkynyloxy, C<sub>2</sub>-C<sub>4</sub> alkoxyalkoxy, C<sub>2</sub>-C<sub>4</sub> haloalkoxyalkoxy, C<sub>2</sub>-C<sub>4</sub> alkylthioalkoxy, C<sub>2</sub>-C<sub>4</sub> haloalkylthioalkoxy, C<sub>2</sub>-C<sub>4</sub> alkylsulfinylalkoxy, C<sub>2</sub>-C<sub>4</sub> haloalkylsulfinylalkoxy, C<sub>2</sub>-C<sub>4</sub> alkylsulfonylalkoxy, C<sub>2</sub>-C<sub>4</sub> haloalkylsulfonylalkoxy, C<sub>2</sub>-C<sub>4</sub> cyanoalkoxy, OCH<sub>2</sub>C(O)CH<sub>3</sub>, OCH<sub>2</sub>CH<sub>2</sub>C(O)CH<sub>3</sub>, C<sub>2</sub>-C<sub>4</sub> aminoalkoxy, C<sub>1</sub>-C<sub>8</sub> alkylthio, C<sub>3</sub>-C<sub>6</sub> cycloalkylthio, C<sub>4</sub>-C<sub>6</sub> cycloalkylalkylthio, C<sub>1</sub>-C<sub>8</sub> haloalkylthio, C<sub>2</sub>-C<sub>6</sub> alkenylthio, C<sub>2</sub>-C<sub>6</sub> haloalkenylthio, C<sub>3</sub>-C<sub>6</sub> alkynylthio, C<sub>3</sub>-C<sub>6</sub> haloalkynylthio, C<sub>2</sub>-C<sub>4</sub> alkoxyalkylthio, C<sub>2</sub>-C<sub>4</sub> haloalkoxyalkylthio, C<sub>2</sub>-C<sub>4</sub> alkylthioalkylthio, C<sub>2</sub>-C<sub>4</sub> haloalkylthioalkylthio, C<sub>2</sub>-C<sub>4</sub> cyanoalkylthio, SCH<sub>2</sub>C(O)CH<sub>3</sub>, SCH<sub>2</sub>CH<sub>2</sub>C(O)CH<sub>3</sub>, C<sub>2</sub>-C<sub>4</sub> aminoalkylthio, SC<sub>6</sub>H<sub>5</sub>, SCH<sub>2</sub>C<sub>6</sub>H<sub>5</sub>, C<sub>1</sub>-C<sub>8</sub> alkylsulfinyl, C<sub>3</sub>-C<sub>6</sub> cycloalkylsulfinyl, C<sub>4</sub>-C<sub>6</sub> cycloalkylalkylsulfinyl, C<sub>1</sub>-C<sub>8</sub> haloalkylsulfinyl, C<sub>2</sub>-C<sub>6</sub> alkenylsulfinyl, C<sub>2</sub>-C<sub>6</sub> haloalkenylsulfinyl, C<sub>3</sub>-C<sub>6</sub> alkynylsulfinyl, C<sub>3</sub>-C<sub>6</sub> haloalkynylsulfinyl, C<sub>2</sub>-C<sub>4</sub> alkoxyalkylsulfinyl, C<sub>2</sub>-C<sub>4</sub> haloalkoxyalkylsulfinyl, C<sub>2</sub>-C<sub>4</sub> cyanoalkylsulfinyl, S(O)CH<sub>2</sub>C(O)CH<sub>3</sub>, S(O)CH<sub>2</sub>CH<sub>2</sub>C(O)CH<sub>3</sub>, C<sub>2</sub>-C<sub>4</sub> aminoalkylsulfinyl, C<sub>2</sub>-C<sub>8</sub> alkylsulfonyl, C<sub>3</sub>-C<sub>6</sub> cycloalkylsulfonyl, C<sub>4</sub>-C<sub>6</sub> cycloalkylalkyl-

 substituted with C<sub>1</sub>-C<sub>4</sub> alkoxy, C<sub>1</sub>-C<sub>4</sub> alkylthio, C<sub>1</sub>-C<sub>4</sub> alkylsulfinyl,  
 C<sub>1</sub>-C<sub>4</sub> alkylsulfonyl, OH, NH<sub>2</sub>, NHCH<sub>3</sub> or N(CH<sub>3</sub>)<sub>2</sub>;  
 X is CH<sub>3</sub>, OCH<sub>3</sub>, OC<sub>2</sub>H<sub>5</sub>, Cl or Br;

Y is C<sub>1</sub>-C<sub>2</sub> alkyl, C<sub>1</sub>-C<sub>2</sub> alkoxy, OCH<sub>2</sub>CH<sub>2</sub>F, OCH<sub>2</sub>CHF<sub>2</sub>, OCH<sub>2</sub>CF<sub>3</sub>, NHCH<sub>3</sub> or N(CH<sub>3</sub>)<sub>2</sub>; and  
Z is CH or N; and  
their agriculturally suitable salts.

CLAIMS

What is claimed is:

- 5        1. A tablet formulation consisting essentially of by total weight of the formulated composition:
  - (i) about 0.1% to 75% of a pesticide;
  - (ii) about 25% to 99.9% of a delivery system characterized by a panel of components complementary to the pesticide of (i) having the following
- 10      components:
  - (a) about 5% to 75% of a dibasic or tribasic organic carboxylic acid or a mixture thereof;
  - (b) about 5% to 75% of an ammonium, lithium, sodium or potassium carbonate or bicarbonate or a mixture thereof;
  - (c) about 0.5% to 20% of a dispersant;
  - (d) about 0.1% to 5% of water-insoluble cross-linked polyvinylpolypyrrolidone;
  - (e) about 0.1% to 5% of an anionic or nonionic wetting agent; and
  - (f) about 1% to 20% of an internal desiccant being selected from the group:
    - (A) one or a mixture of desiccants that chemically bind water, and
    - (B) one or a mixture of desiccants that physically adsorb water;the desiccant being (A) when (b) is potassium carbonate or potassium bicarbonate.
- 15      2. A tablet formulation according to Claim 1 wherein (b) is an ammonium, sodium or lithium carbonate or bicarbonate or mixture thereof, and the internal desiccant is selected from (A), (B) and a mixture of (A) and (B).
- 20      3. A tablet formulation according to Claim 1 wherein (b) is potassium carbonate or bicarbonate or mixture thereof, and the internal desiccant is (A).
- 25      4. A tablet formulation according to Claim 1 in the form of a tablet.
- 30      5. A tablet formulation according to Claim 2 in the form of a tablet.
- 35      6. A tablet formulation according to Claim 3 in the form of a tablet.
- 35      7. A tablet formulation according to any one of Claims 1 to 6 wherein the pesticide is a sulfonylurea herbicide selected from the group consisting of chlorsulfuron, sulfometuron methyl, chlorimuron ethyl, metsulfuron methyl, ethametsulfuron methyl, thifensulfuron methyl, tribenuron ethyl, bensulfuron methyl, primisulfuron, methyl 2-[[[[[(4,6-dimethoxy-2-pyrimidinyl)amino]-

- carbonyl]amino]sulfonyl]-6-(trifluoro-methyl)-3-pyridinecarboxylate, 2-(2-chloroethoxy)-N-[[[(4-methoxy-6-methyl-1,3,5-triazin-2-yl)amino]carbonyl]-benzenesulfonamide, ethyl 5-[[[[[(4,6-dimethoxy-2-pyrimidinyl)amino]carbonyl]-amino]sulfonyl]-1-methyl-1*H*-pyrazole-4-carboxylate, *N*-[[[(4,6-dimethoxy-2-pyrimidinylamino]carbonyl]-3-(ethylsulfonyl)-2-pyridinesulfonamide, 2-[[[[[(4,6-dimethoxy-2-pyrimidinyl)amino]carbonyl]amino]sulfonyl]-*N,N*-dimethyl-3-pyridinecarboxamide, and methyl 2-[[[[[4-(dimethylamino)-6-(2,2,2-trifluoroethoxy)-1,3,5-triazin-2-yl]amino]carbonyl]sulfonyl]-3-methylbenzoate.
8. A tablet formulation according to Claim 7 wherein the pesticide is a sulfonlurea herbicide selected from the group consisting of thifensulfuron methyl, tribenuron ethyl, and bensulfuron methyl.
